Welcome and thanks for purchasing a Grace Design Spacebar microphone positioner. We build all of our products to be completely reliable and easy to use, so you can concentrate on making great recordings, not struggling with complicated equipment or difficult product manuals. While you will find the Spacebar is completely straightforward to use, we do ask that you familiarize yourself with this product manual to help avoid any common user difficulties.

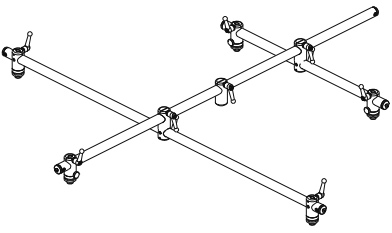

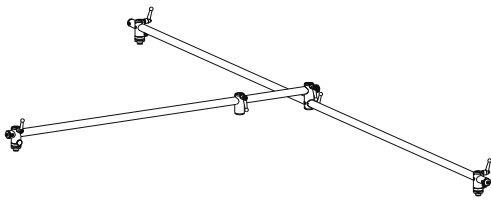

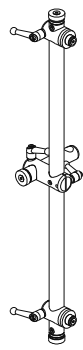

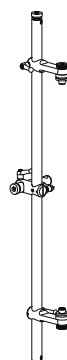

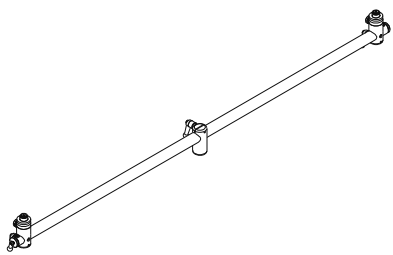

The Grace Design Spacebar modular microphone positioning system allows for precise and repeatable setting of microphone capsule spacing and angle of incidence in a wide array of microphone configurations. With precision scales for angle and distance engraved on the Spacebar components, it becomes easy to make perfectly repeatable stereo and multichannel microphone setups.

The Spacebar modular system components can be purchased in pre-configured assemblies for several standard microphone arrays. As well, it is possible to build a virtually limitless range of microphone holding structures to meet any need.

The Spacebar system is precision fabricated from machined aircraft aluminum, brass, and stainless steel. If properly cared for it should last a lifetime. In the event that you encounter any technical or operational difficulties with this or any Grace Design products, please feel free to contact us at 303-443-7454, 9 to 5, Monday through Friday, MST. Or you can email any questions to: info@gracedesign.com

Standard Pre-configured Arrays:

| | |
|--|---|
| <p>SB-SUR Surround Tree</p> <p>Holds 5 microphones</p> |  |
| <p>SB-DT Decca Tree</p> <p>Standard 3 microphone tree 2M x 1M</p> |  |
| <p>SB-BL Blumlein</p> <p>Holds standard large diaphragm microphones in a vertical Blumlein configuration.</p> |  |
| <p>SB-BLRA Blumlein right angle</p> <p>Holds RCA 44 type ribbon microphones in a vertical Blumlein configuration.</p> |  |
| <p>SB-100 1 meter AB bar</p> <p>Straight 1 meter stereo bar. Can be extended to 2 meters.</p> |  |

Spacebar Modular Components:

SB-AMH Adjustable Mic Holder

Mic holder with precision angle scale. 5 degree markings from +90 to -90 degrees.

SB-MH Standard Mic Holder

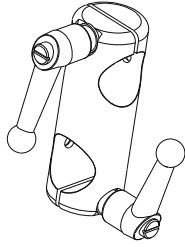

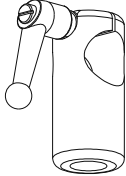

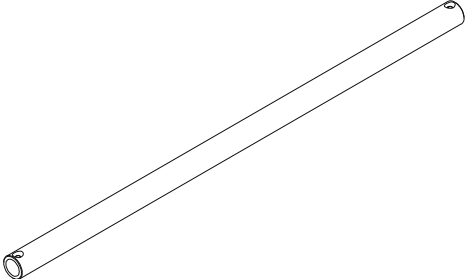

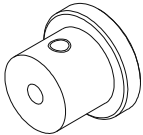

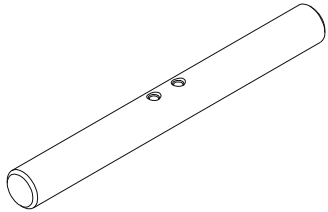

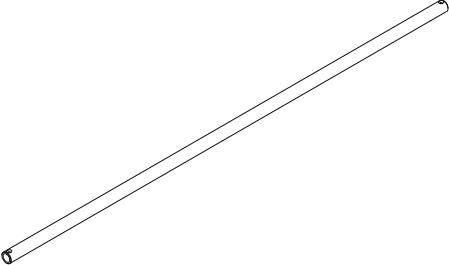

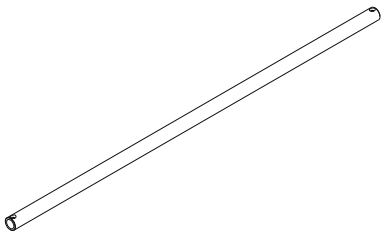

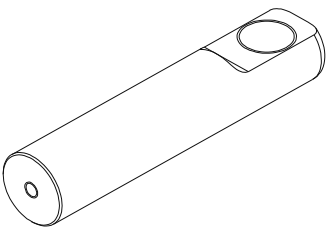

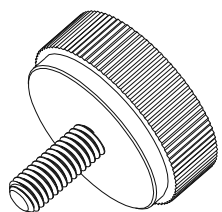

SB-AMHRA Adjustable Mic Holder, Right Angle

SB-HB Hanging Bar

| | |
|--|---|
| <p>SB-TJ90 90 Degree Tube Joiner</p> <p>Allows any two 7/8" tubes to be joined at a 90 degree angle.</p> |  |
| <p>SB-SMA Stand Mount Adapter 5/8"- 27 thread</p> <p>Comes with 3/8-16 European style thread adapter.</p> |  |
| <p>E407 53cm bar</p> <p>7/8" diameter, LASER etched scale reads 25-0-25cm.</p> |  |
| <p>E414 tube end plug</p> <p>Attaches to the end of any of the 7/8" tubes. Provides a threaded hole for attaching hooks for guide lines or an E414 24m thumb screw to provide a safety stop for microphone holders.</p> |  |
| <p>E418 Tube Joiner</p> <p>Joins any two 7/8" tubes. Made from very strong 304 stainless steel.</p> |  |

| | |
|---|---|
| E420 105cm bar |  |
| E421 80cm bar |  |
| E422 90 degree stand mount |  |
| E405 42mm thumb nut w/ #10-32 x 7/8" screw |  |

Note: All components which feature microphone mounts come standard with 5/8-27 American standard threads. As well, all microphone mounts can be ordered with the European standard 3/8-16 British Standard Whitworth threads. These part numbers will have a - BSW suffix.

Spacebar Configurations Detail

Surround Tree

The SB-SUR system allows for mounting of 5 microphones. In its standard configuration three microphones can be mounted as a “front triplet” and two microphones can be mounted as a rear pair. All microphone spacings can be precisely adjusted using the engraved centimeter scales on the bars. Also, all microphone angles of incidence can be precisely adjusted in 5 degree increments.

The front left and right microphone holder spacing can be adjusted from 6cm to 102cm if using the E420 105cm bar and 6cm to 50cm E407 53cm bar.

For surround microphone arrays using the SB-SUR system we highly recommend visiting <http://www.mmad.info>. This website was created by Michael Williams who has written much about multichannel microphone array design. It contains an interactive design decision sequence for tailoring your microphone configuration to your specific acoustic venue. The underlying theory for this design approach is contained in a series of AES papers written by Michael Williams.

fig 1: Surround Tree

See the SB-SUR system [exploded parts diagram](#) for a list of included components.

Decca Tree

This classic microphone configuration was developed by Decca Records engineers in the 1950s. The Spacebar Decca Tree configuration provides a simple, precise, and easy to set up solution for this technique. The standard Spacebar Decca Tree comes with three E420 1 meter tubes, an SB-SMA 5/8"-27 stand mount adapter and three SB-AMH adjustable mic holders. These are configured to provide a 2 meter spacing between left and right microphones and a center microphone 1 meter forward. Since the stand mount adapter can move front to back on the 1 meter tube it should be located at the balance point for maximum stability.

fig. 2: Decca Tree

See the SB-DT system [exploded parts diagram](#) for a list of included components.

Blumlein

The Blumlein stereo micing technique was pioneered by Alan Blumlein in the 1930s. The Spacebar Blumlein configuration allows for holding two figure-8 microphones on the same vertical axis and at a precise 90 degree angle of incidence. Two types of mic holder are available depending on the microphones being used. For RCA 44 and RCA 77 type mics and their derivatives the SB-AMHRA holder should be used. Most other microphones can be mounted with the SB-MH standard mic holder.

A unique feature of the Spacebar Blumlein configuration is that the whole vertical tube assembly can be rotated on a horizontal axis allowing the mics to be aimed up or down

relative to the horizontal plane. This can be very useful when micing and ensemble from above on a tall stand.

fig. 3: **SB-BLRA Blumlein with SB-AMHRA right angle mic holders (shown with RCA 44 type mics)**

See the SB-BLRA system [exploded parts diagram](#) for a list of included components.

fig. 4: **SB-BL Blumlein with SB-MH standard mic holders**

See the SB-BL system [exploded parts diagram](#) for a list of included components.

AB Stereo

The AB Stereo microphone technique typically uses two omni-directional microphones spaced apart by a distance. The SB-100 configuration is basically a 1M wide stereo bar. With the addition of another E420 tube and a E418 joiner tube, the SB-100 becomes an SB-200 2 meter stereo bar.

fig. 5: **SB-100**

See the SB-100 system [exploded parts diagram](#) for a list of included components.

Hanging Arrays

For applications that require hanging a microphone array from a ceiling, the SB-HB hanging bar can be used. The SB-HB can be used with the SB-SUR surround tree, SB-DT Decca tree, and the SB-100 AB bar. The SB-HB has a 1 inch eye-bolt on one end and threads into the SB-SMA stand mount adapter at the other. The SB-HB can be ordered in two versions:

1. SB-HB-1M with a guide line yoke sized for 1 meter wide bars.
2. SB-HB-2M with a guide line yoke sized for 2 meter wide bars.

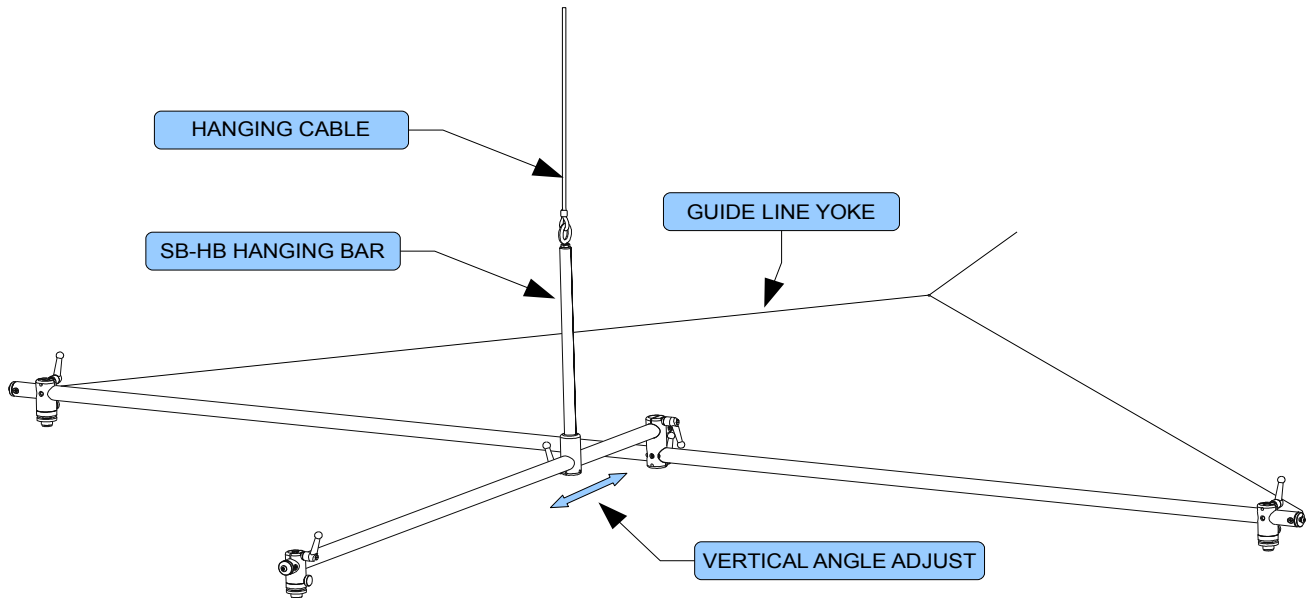

fig. 6: Decca Tree with SB-HB Hanging Bar

Setup Basics

SB-AMH/SB-MH

All of the modular microphone holder assemblies use adjustable clamping handles to tighten and loosen the holder from the tube it is mounted on. Turning the handle clockwise will tighten or “clamp” the holder in position on the tube. The clamping action is very secure and does not require extreme torque on the handle. As well, the final position of the handle can be adjusted by pulling on the handle while rotating. This allows the handle to be adjusted so that it can be at a convenient angle for tightening or loosening.

fig. 7: SB-AMH Adjustable Mic Holder

The angle of incidence of a mounted microphone can be precisely set by using the angle indicating protractor markings which are engraved on the front of the SB-AMH. The angle is indicated from +90 to -90 degrees in 5 degree increments. **The angle adjust thumb screw must be loosened before rotating the upper portion of the microphone holder.**

fig. 8: SB-AMH Adjustable Mic Holder showing protractor markings and sight hole

To calibrate the angle of incidence, follow these steps:

- A) Loosen locking thumb screw and rotate mic holder so that 0 degrees is indicated. Then re-tighten the thumb screw.
- B) Thread on the microphone clip and orient it so that it is perpendicular to the Spacebar tube.
- C) Lock the microphone clip in place by tightening the jam nut against it.
- D) Now the angle of the microphone can be precisely adjusted by loosening the thumb screw and rotating the microphone.

The location of the microphone holder can be precisely set by using the numeric scales engraved on the tubes. The SB-MH and SB-AMH feature a sight hole that allows microphone holder to be positioned on the centimeter indicator circles. The SB-TJ90 tube joiner also has sight holes allowing for proper centering of cross bars and measurement between cross bars and microphone holders. The scales on the various bars are indicated as follows:

- E420 indicated in centimeters and reads 0 to 105cm from left to right and 105 to 0cm right to left.
- E421 indicated in centimeters and reads 40-0-40cm.
- E407 indicated in centimeters and reads 25-0-25cm from the center.

E418 Tube Joiner

The E418 tube joiner is used to connect any two of the 7/8" diameter tubes. Typically used for the 2 meter segment of the Decca Tree or for very wide stereo bars. To join two tubes simply slide the tube joiner bar into one of the tubes and secure with the 8-32 x 1/4" flat head screw. Next, slide the second tube over the joiner bar and secure with the other screw. See diagram below.

fig. 9: E418 tube joiner bar assembly

SB-HB Hanging Bar

The SB-HB assembly threads into the SB-SMA stand mount adapter as shown below.

fig. 10: SB-HB assembly

When hanging the microphone array can be aligned to the sound source by attaching the supplied guide line yoke to the ends of the 7/8" tubes. With user supplied line the yoke can be tied to an appropriate anchor point in the venue. These yoke lines are adjustable so that the microphone array can be precisely aimed. Adjustments can be made by slipping the mono-filament line through the shrink tubing to shorten one side of the yoke while effectively lengthening the other.

fig 11. Guide Line Yoke

The ends of the yoke guide lines attach to the s-hooks on the ends of whatever bar is being used. The s-hooks (supplied with your Spacebar system) must be mounted to the end plugs of the tube with the supplied #10-32 x 1/2" button head cap screw. Use a 1/8" hex wrench. Do not tighten the screw so much that it binds the s-hook. The screw has a thread locking compound applied to its threads so it will not loosen after screw is installed.

fig. 12: Bar end s-hook installation

fig. 13: guide line yoke attachment

The vertical angle of the array can be adjusted by moving the stand mount adapter forward or rearward of the balance point.
